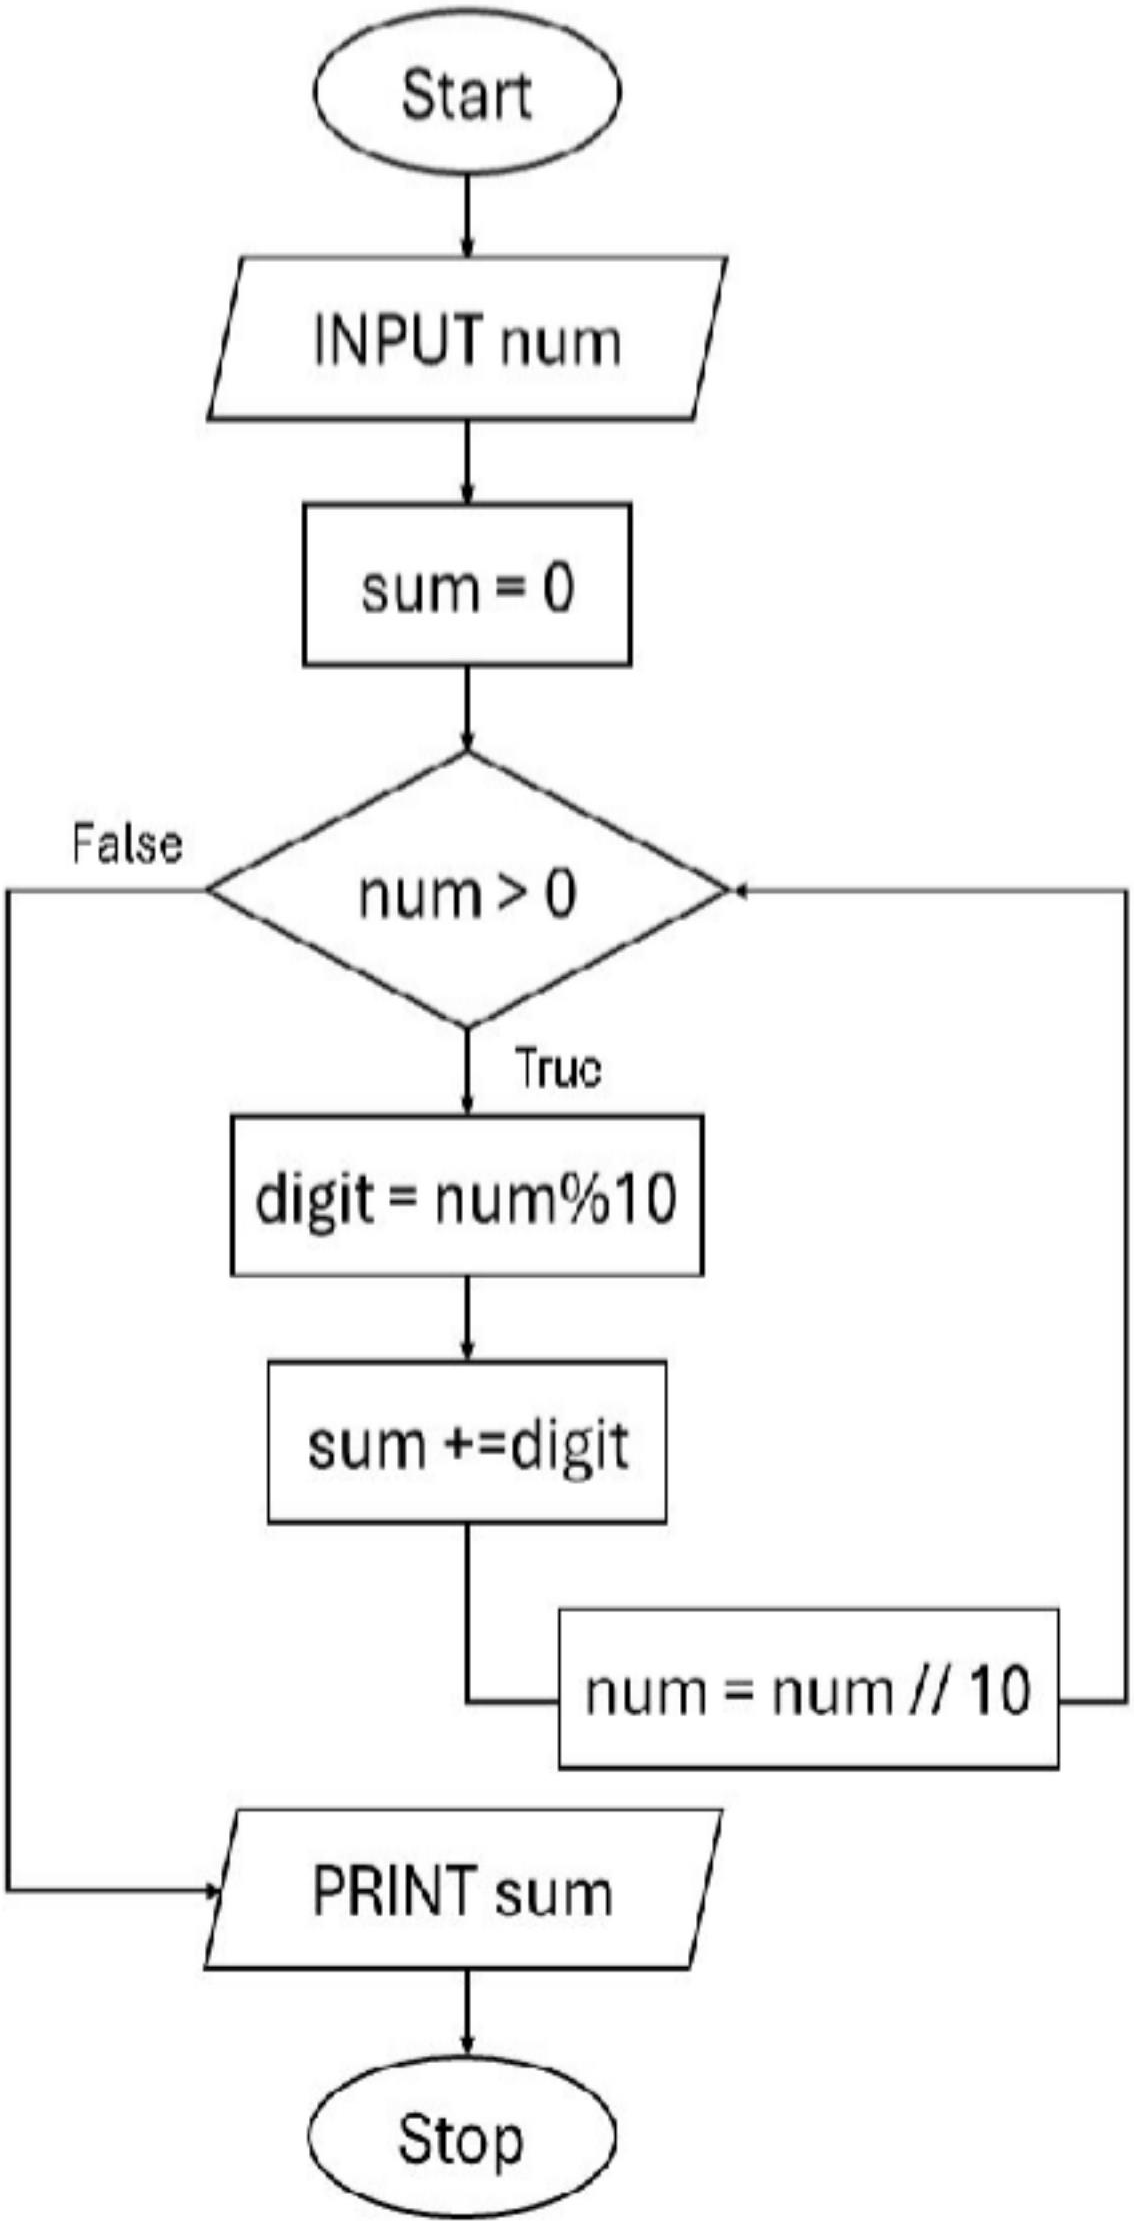
# Experiment 11

## 11.1.1 Sum of digits

## Algorithm :

**Step 1** : Start
**Step 2** : Input an integer and store it in num
**Step 3** : Set sum to 0
**Step 4** : Repeat steps 5 through 7 while num is greater than 0
**Step 5** : Find the last digit using the modulo operator:
  digit = num % 10
**Step 6** : Add the digit to the current sum
**Step 7** : Remove the last digit using integer division:
  num = num // 10
**Step 8** : Go back to Step 4
**Step 9** : Once num becomes 0, exit the loop
**Step 10** : Print the final value of sum
**Step 11** : Stop

## Flowchart :



Start
INPUT num
sum = 0
False
num > 0
Truc
digit = num%10
sum +=digit
num = num // 10
PRINT sum
Stop

## Code :

```
num = int(input("Enter a number: "))
sum=0
while num>0:
    i=num%10
    sum=sum+i
    num=num//10
print("Sum of digits:",sum)
```

## 11.1.1. Sum of Digits of a Number

04:58

Write a Python program that reads an integer, calculates the sum of its digits, and prints the result.

**Input Format:**

- The program reads an integer input with the prompt "Enter a number: "

**Output Format:**

- Print the sum of the digits in the format:

```
Sum of digits: <digit_sum>
```

**Note:**

- Some base code was provided (input and print statements). The task was to complete the missing logic.

Sample Test Cases +

sumofdig...

Submit

Debugger

```python
num = int(input("Enter a number: "))
sum=0
while num>0:
    i=num%10
    sum=sum+i
    num=num//10
print("Sum of digits:",sum)
```

| Average time | Maximum time |
|---|---|
| 0.005 s | 0.008 s |
| 5.25 ms | 8.00 ms |

2 out of 2 shown test case(s) passed

2 out of 2 hidden test case(s) passed

Test case 1 8 ms Debug

| Expected output | Actual output |
|---|---|
| Enter a number: 123 | Enter a number: 123 |
| Sum of digits: 6 | Sum of digits: 6 |

Test case 2 5 ms
